Four-point contact ball bearings 451

Double row cam rollers 463

Angular contact ball bearings

Angular contact ball bearings have raceways in the inner and outer rings that are displaced with respect to each other in the direction of the bearing axis. This means that they are designed to accommodate combined loads, i.e. simultaneously acting radial and axial loads.

The axial load carrying capacity of angular contact ball bearings increases with increasing contact angle. The contact angle is defined as the angle between the line joining the points of contact of the ball and the raceways in the radial plane, along which the load is transmitted from one raceway to another, and a line perpendicular to the bearing axis.

SKF angular contact ball bearings are produced in a wide variety of designs and sizes. Those commonly used in general engineering are

- single row angular contact ball bearings ([→ fig. 1](#))
- double row angular contact ball bearings ([→ fig. 2](#))
- four-point contact ball bearings ([→ fig. 3](#))
- double row cam rollers ([→ fig. 4](#)).

Detailed information about these bearing and cam rollers belonging to the SKF standard assortment is provided on the following pages.

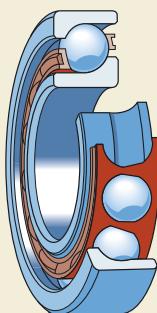

Fig. 1

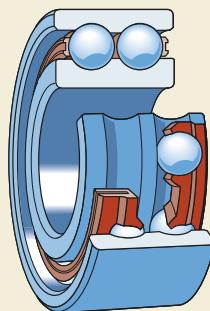

Fig. 2

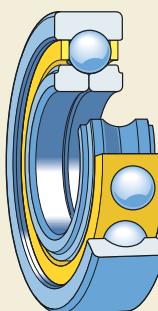

Fig. 3

Fig. 4

Other SKF angular contact ball bearings

Angular contact ball bearings listed in this catalogue constitute the basic SKF assortment and are only part of the total range of SKF angular contact ball bearings. Other products also belonging to the range are briefly described in the following.

High-precision angular contact ball bearings

The comprehensive range of SKF high-precision angular contact ball bearings covers bearings in three different Dimension Series and a wide range of different design variants. It includes single bearings, universally matchable bearings and matched bearing sets

- without or with low-friction seals
- with three different contact angles
- with steel or ceramic balls
- in standard design (→ fig. 5) or high-speed design.

Fixed section angular contact ball bearings

These bearing have very thin rings and a constant cross section within a particular series, irrespective of the bearing size. They are further characterized by low weight and high stiffness. SKF fixed section bearings (→ fig. 6) are inch dimension bearings and available as either open or sealed

- single row angular contact ball bearings
- four-point contact ball bearings

in up to eight different cross sections.

Hub bearings units

Hub bearings units (HBU) for the automotive industry are based on double row angular contact ball bearings (→ fig. 7). They have made an appreciable contribution to the achievement of more compact weight-saving designs, simplified assembly and enhanced reliability.

Detailed information about these products will be supplied on request.

Designs

A single row angular contact ball bearing can accommodate axial loads acting in one direction only. The bearing is normally adjusted against a second bearing.

The standard assortment of SKF angular contact ball bearings comprises bearings in the 72 B and 73 B series. Two versions are available for different purposes

- basic design bearings (not universally matchable) – can only be used for arrangements with single bearings
- bearings for universal matching.

The bearings have a 40° contact angle (→ fig. 1) and therefore can support heavy axial loads. They are non-separable and the bearing rings have one high and one low shoulder. The low shoulder enables a large number of balls to be incorporated in the bearing, thus giving the bearing a relatively high load carrying capacity.

In addition, SKF single row angular contact ball bearings are available in many other dimension series, designs, and sizes. For further information about these bearings, consult the "SKF Interactive Engineering Catalogue" online at www.skf.com.

Basic design bearings

Basic design single row angular contact ball bearings are intended for arrangements where only one bearing is used at each bearing position. They have Normal tolerances concerning bearing width and standout of the rings. Therefore, they are not suitable for mounting directly adjacent to each other.

Bearings for universal matching

Bearings for universal matching are specifically manufactured so that when mounted in random order, but immediately adjacent to each other, a given internal clearance or preload and/or an even load distribution will be obtained without the use of shims or similar devices. Universally matchable bearings carry a designation suffix to indicate the internal clearance (CA, CB, CC) or preload (GA, GB, GC) of a set of two, prior to mounting.

When ordering, it is necessary to state the number of individual bearings required and not the number of sets.

Paired mounting (→ fig. 2) is used when the load carrying capacity of a single bearing is inadequate (tandem arrangement) or when combined or axial loads act in both directions (back-to-back and face-to-face arrangements).

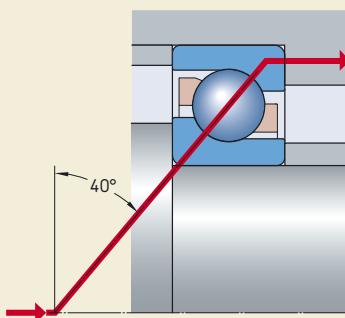

When arranged in tandem (a) the load lines are parallel and the radial and axial loads are equally shared by the bearings. However, the bearing set can only accommodate axial loads acting in one direction. If axial loads act in the opposite direction, or if combined loads are present, a third bearing adjusted against the tandem pair must be added.

The load lines of bearings arranged back-to-back (b) diverge towards the bearing axis. Axial loads acting in both directions can be accommodated, but only by one bearing in each direction. Bearings mounted back-to-back provide a relatively stiff bearing arrangement that can also accommodate tilting moments.

The load lines of bearings mounted face-to-face (c) converge towards the bearing axis. Axial loads acting in both directions can be accommodated, but only by one bearing in each direction. This arrangement is not as stiff as the back-to-back arrangement and is less suitable for the accommodation of tilting moments.

Bearings for universal matching can also be beneficial in arrangements with single bearings. Most bearings are SKF Explorer and as such have higher precision, increased carrying capacity and speed capability.

Fig. 1

SKF Explorer class bearings

High performance SKF Explorer angular contact ball bearings are shown with an asterisk in the product table. SKF Explorer bearings retain the designation of the earlier standard bearings, e.g. 7208 BECBP. However, each bearing and its box are marked with the name "EXPLORER".

Bearing data – general

Dimensions

The boundary dimensions of SKF single row angular contact ball bearings are in accordance with ISO 15:1998.

Tolerances

Basic design SKF single row angular contact ball bearings for single mounting are produced to Normal tolerances. Standard design universally matchable bearings are manufactured to better than Normal tolerances.

SKF Explorer angular contact ball bearings are manufactured only as bearings for universal matching with P6 dimensional accuracy and P5 running accuracy.

The values for tolerances correspond to ISO 492:2002 and can be found in **tables 3 to 5**, starting on **page 125**.

Internal clearance and preload

Internal clearance in single row angular contact ball bearings is only obtained after mounting and is dependent on adjustment against a second bearing, which provides axial location in the opposite direction.

SKF universally matchable bearings are produced in three different clearance and preload classes each. The classes for bearing sets with clearance are

- CA – smaller than Normal axial clearance
- CB – Normal axial clearance (standard)
- CC – larger than Normal axial clearance.

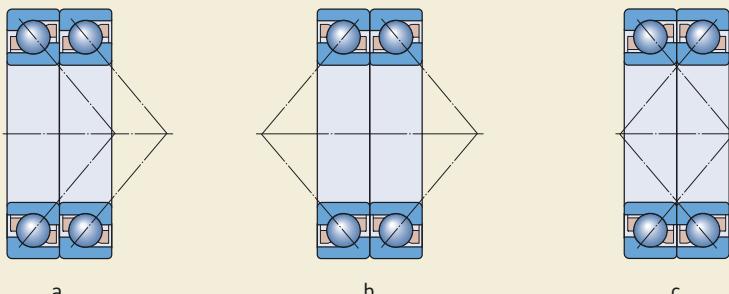

Bearings to clearance class CB are standard. The availability of bearings to other clearance classes can be obtained from **matrix 1 on page 419**. SKF universally matchable bearings with clearance can be combined in sets of any number of bearings.

The classes for bearing sets with preload are

- GA – light preload (standard)
- GB – moderate preload
- GC – heavy preload.

Bearings to GA class preload are standard (**→ matrix 1 on page 419**). Bearings with preload can only be paired in sets of two bearings, in contrast to the SKF universally matchable bearings with clearance, as otherwise the preload would increase.

Fig. 2

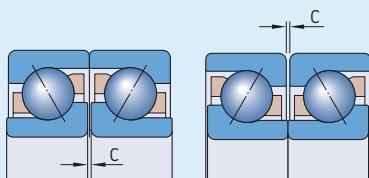

Single row angular contact ball bearings

The values for the clearance classes are provided in **table 1** and for the preload classes in **table 2**. The values apply to unmounted bearing sets, arranged back-to-back or face-to-face, and in case of clearance to zero measuring loads.

Misalignment

Single row angular contact ball bearings have only limited ability to accommodate misalignment. The permissible misalignment of the shaft relative to the housing that will not produce inadmissibly heavy additional forces, depends on the operating clearance in the bearing, bearing size, internal design and the forces and moments acting on the bearing. Because of the complex relationship between the influencing factors, it is not possible to quote any values that are universally valid.

For bearings mounted in sets, particularly those with small axial internal clearance mounted in a back-to-back arrangement, misalignment can only be accommodated by increased ball loads, which will create cage stresses and reduce bearing service life. Any misalignment of the bearing rings will also lead to increased running noise.

Influence of operating temperature on bearing material

SKF angular contact ball bearings undergo a special heat treatment. When fitted with a steel, brass or PEEK cage, they can operate at temperatures of up to +150 °C.

Cages

Depending on the bearing series and size, SKF single row angular contact ball bearings are fitted as standard with one of the following cages (→ fig. 3)

- an injection moulded window-type cage of glass fibre reinforced polyamide 6,6, ball centred, designation suffix P (**a**)
- an injection moulded window-type cage of glass fibre reinforced polyetheretherketone (PEEK), ball centred, designation suffix PH
- a pressed window-type brass cage, ball centred, designation suffix Y (**b**)
- a machined window-type brass cage, ball centred, designation suffix M (**c**).

The available SKF standard assortment is shown in **matrix 1 on page 419**. If bearings with a PEEK cage are required other than listed, please consult SKF.

Bearings having a pressed window-type steel cage, designation suffix J, or a machined

window-type steel cage, designation suffix F, may also be available. Please check availability prior to ordering.

Note

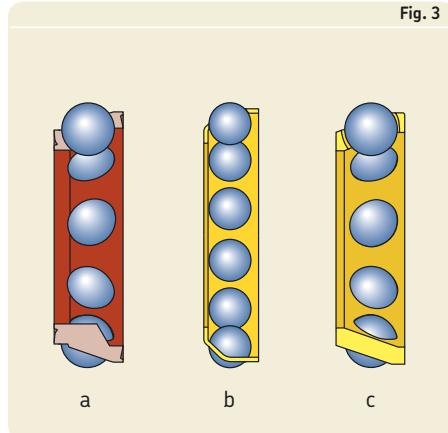

Bearings with polyamide 6,6 cages can be operated at temperatures up to +120 °C. The lubricants generally used for rolling bearings do not have a detrimental effect on cage properties, with the exception of a few synthetic oils and greases with a synthetic oil base, and lubricants containing a high proportion of EP additives when used at high temperatures.

For detailed information about the temperature resistance and the applicability of cages, please refer to the section "Cage materials", starting on **page 140**.

Speed ratings for bearing pairs

For bearings arranged in pairs, the reference speeds provided in the product table for single bearings should be reduced by approximately 20 %.

Fig. 3

Load carrying capacity of bearing pairs

The values for basic load ratings and fatigue load limits provided in the product table apply to single bearings. For bearing pairs mounted immediately adjacent to each other the following values apply

- basic dynamic load rating for standard bearings in all arrangements and for SKF Explorer bearings in back-to-back or face-to-face arrangement

$$C = 1,62 \times C_{\text{single bearing}}$$

- basic dynamic load rating for SKF Explorer bearings in tandem arrangement

$$C = 2 \times C_{\text{single bearing}}$$

- basic static load rating

$$C_0 = 2 \times C_{0 \text{ single bearing}}$$

- fatigue load limit

$$P_u = 2 \times P_{u \text{ single bearing}}$$

Minimum load

In order to provide satisfactory operation, angular contact ball bearings, like all ball and roller bearings, must always be subjected to a given minimum load, particularly if they are to operate at high speeds or are subjected to high accelerations or rapid changes in the direction of load. Under such conditions, the inertia forces of the balls and cage, and the friction in the lubricant, have a detrimental influence on the rolling conditions in the bearing arrangement and may cause damaging sliding movements to occur between the balls and raceways.

The requisite minimum load to be applied to single bearings and bearing pairs arranged in tandem can be estimated using

$$F_{am} = k_a \frac{C_0}{1000} \left(\frac{n d_m}{100000} \right)^2$$

and for bearing pairs arranged back-to-back or face-to-face from

$$F_{rm} = k_r \left(\frac{v n}{1000} \right)^{2/3} \left(\frac{d_m}{100} \right)^2$$

Table 3

Minimum load factors		
Bearing series	Minimum load factors k_a	k_r
72 BE	1,4	0,095
72 B	1,2	0,08
73 BE	1,6	0,1
73 B	1,4	0,09

where

F_{am} = minimum axial load, kN

F_{rm} = minimum radial load, kN

C_0 = basic static load rating of single bearing, or bearing pair, kN (\rightarrow product table)

k_a = minimum axial load factor according to table 3

k_r = minimum radial load factor according to table 3

v = oil viscosity at operating temperature, mm^2/s

n = rotational speed, r/min

d_m = bearing mean diameter
= $0,5(d + D)$, mm

When starting up at low temperatures or when the lubricant is highly viscous, even greater minimum loads may be required. The weight of the components supported by the bearing, together with external forces, generally exceeds the requisite minimum load. If this is not the case, the angular contact ball bearing must be subjected to an additional load. Single bearings and bearing pairs arranged in tandem can be axially preloaded by adjusting the inner or outer rings against each other, or by using springs.

Equivalent dynamic bearing load

For single bearings and bearings paired in tandem

$$\begin{aligned} P &= F_r && \text{when } F_a/F_r \leq 1,14 \\ P &= 0,35 F_r + 0,57 F_a && \text{when } F_a/F_r > 1,14 \end{aligned}$$

When determining the axial force F_a , reference should be made to the section "Determining axial force for bearings mounted singly or paired in tandem".

For bearings mounted in pairs, arranged back-to-back or face-to-face

$$\begin{aligned} P &= F_r + 0,55 F_a && \text{when } F_a/F_r \leq 1,14 \\ P &= 0,57 F_r + 0,93 F_a && \text{when } F_a/F_r > 1,14 \end{aligned}$$

F_r and F_a are the forces acting on the bearing pair.

Equivalent static bearing load

For single bearings and bearings paired in tandem

$$P_0 = 0,5 F_r + 0,26 F_a$$

If $P_0 < F_r$, then $P_0 = F_r$ should be used. When determining the axial force F_a , reference should be made to the section "Determining axial force for bearings mounted singly or paired in tandem".

For bearings mounted in pairs, arranged back-to-back or face-to-face

$$P_0 = F_r + 0,52 F_a$$

F_r and F_a are the forces acting on the bearing pair.

Determining axial force for bearings mounted singly or paired in tandem

When a radial load is applied, the load is transmitted from one raceway to the other at an angle to the bearing axis and an internal axial force will be induced in single row angular contact ball bearings. This must be considered when calculating the equivalent bearing loads for bearing arrangements consisting of two single bearings and/or bearing pairs arranged in tandem.

The necessary equations are provided in **table 4, page 416**, for the various bearing arrangements and load cases. The equations are only valid if the bearings are adjusted against each other to practically zero clearance, but without any preload. In the arrangements shown, bearing A is subjected to a radial load F_{rA} and bearing B to a radial load F_{rB} . Both F_{rA} and F_{rB} are always considered positive, even when they act in the direction opposite to that shown in the figures. The radial loads act at the pressure centres of the bearings (see dimension a in the product table).

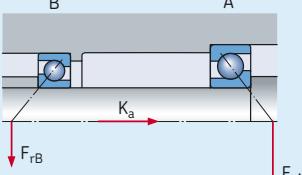

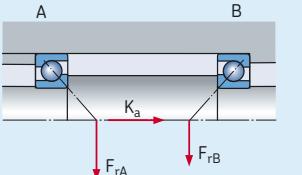

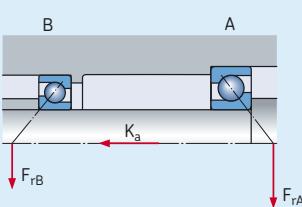

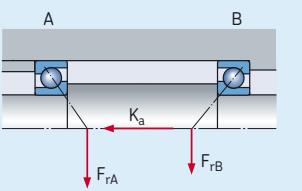

Variable R

The variable R from **table 4** takes into account the contact conditions inside the bearing. The values for R can be obtained from **diagram 1, page 417**, as a function of the ratio K_a/C . K_a is the external axial load acting on the shaft or on the housing and C is the basic dynamic load rating of the bearing, which must accommodate the external axial load. For $K_a = 0$ use $R = 1$.

Single row angular contact ball bearings

Table 4

Axial loading of bearing arrangements incorporating two single row B or BE design angular contact ball bearings and/or bearing pairs in tandem

Bearing arrangement	Load case	Axial forces	
Back-to-back	Case 1a  $F_{rA} \geq F_{rB}$ $K_a \geq 0$	$F_{aA} = R F_{rA}$	$F_{aB} = F_{aA} + K_a$
Face-to-face	Case 1b  $F_{rA} < F_{rB}$ $K_a \geq R (F_{rB} - F_{rA})$	$F_{aA} = R F_{rA}$	$F_{aB} = F_{aA} + K_a$
Back-to-back	Case 1c  $F_{rA} < F_{rB}$ $K_a < R (F_{rB} - F_{rA})$	$F_{aA} = F_{aB} - K_a$	$F_{aB} = R F_{rB}$
Face-to-face	Case 2a  $F_{rA} \leq F_{rB}$ $K_a \geq 0$	$F_{aA} = F_{aB} + K_a$	$F_{aB} = R F_{rB}$
	Case 2b  $F_{rA} > F_{rB}$ $K_a \geq R (F_{rA} - F_{rB})$	$F_{aA} = F_{aB} + K_a$	$F_{aB} = R F_{rB}$
	Case 2c $F_{rA} > F_{rB}$ $K_a < R (F_{rA} - F_{rB})$	$F_{aA} = R F_{rA}$	$F_{aB} = F_{aA} - K_a$

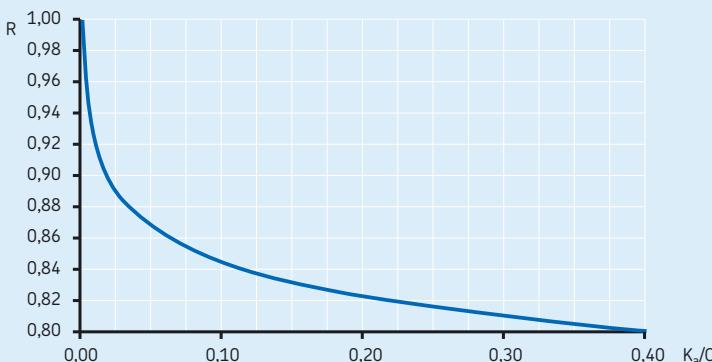

Supplementary designations

The designation suffixes used to identify certain features of SKF single row angular contact ball bearings are explained in the following.

- A** 30° contact angle
- AC** 25° contact angle
- B** 40° contact angle
- CA** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have an axial internal clearance smaller than Normal (CB) before mounting
- CB** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have a Normal axial internal clearance before mounting
- CC** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have an axial internal clearance greater than Normal (CB) before mounting
- DB** Two bearings matched back-to-back
- DF** Two bearings matched face-to-face
- DT** Two bearings matched in tandem
- E** Optimized internal design
- F** Machined window-type steel cage, ball centred
- GA** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have a light preload before mounting

- GB** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have a moderate preload before mounting
- GC** Bearing for universal matching. Two bearings arranged back-to-back or face-to-face will have a heavy preload before mounting
- J** Pressed window-type steel cage, ball centred
- M** Machined window-type brass cage, ball centred, different designs are identified by a figure, e.g. M1
- N1** One locating slot (notch) in the large outer ring side face
- N2** Two locating slots (notches), 180° apart, in the large outer ring side face
- P** Injection moulded window-type cage of glass fibre reinforced polyamide 6,6, ball centred
- PH** Injection moulded window-type cage of glass fibre reinforced polyetheretherketone (PEEK), ball centred
- P5** Dimensional and running accuracy to ISO tolerance class 5
- P6** Dimensional and running accuracy to ISO tolerance class 6
- W64** Solid Oil filling
- Y** Pressed window-type brass cage, ball centred

Diagram 1

Design of bearing arrangements

When designing bearing arrangements incorporating single row angular contact ball bearings, remember that these bearings must either be used with a second bearing or in sets (→ fig. 4).

When two single row angular contact ball bearings are used, they must be adjusted against each other until the requisite preload or clearance is obtained (→ section "Bearing preload", starting on page 206).

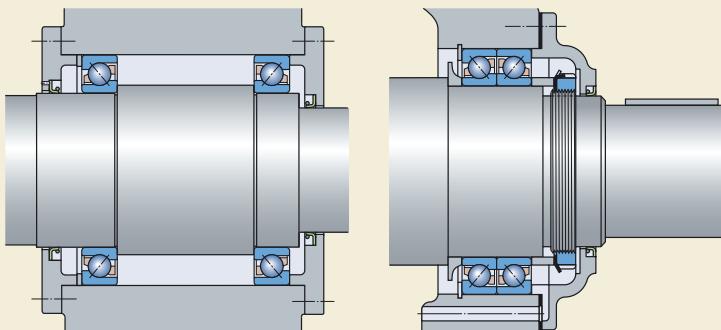

Where bearings for universal matching are used and the bearings are mounted immediately adjacent to each other, there is no need for adjustment. The requisite preload or clearance is obtained by choosing bearings from an appropriate preload or clearance class and by applying suitable fits for the bearings on the shaft and in the housing.

It is important for proper bearing performance and for the operational reliability of the arrangement that the bearings are correctly adjusted, or that the correct choice of preload or clearance has been made. If the clearance of the bearing in operation is too large, the load carrying capacity of the bearings will not be fully utilized; on the other hand, excessive preload will produce more friction and higher operating

temperatures, leading to a reduction in bearing service life. It should also be remembered that with 72 B and 73 B series single row angular contact ball bearings (40° contact angle), correct rolling conditions will only be achieved in the bearing when the load ratio $F_a/F_r \geq 1$.

Special attention should also be paid to back-to-back and face-to-face arrangements where the axial load acts predominantly in one direction. This creates an unfavourable rolling condition for the balls of the unloaded bearing and can lead to noise, discontinuity in the lubricant film and increased stressing of the cage. Under these conditions, zero operational clearance is recommended and should be attained, for example, by using springs. For additional information contact the SKF application engineering service.

Designs

SKF double row angular contact ball bearings correspond in design to two single row angular contact ball bearings but take up less axial space. They can accommodate radial loads as well as axial loads acting in both directions. They provide stiff bearing arrangements and are able to accommodate tilting moments.

The SKF standard range of double row angular contact ball bearings (→ **fig. 1**) includes

- basic design bearings (**a**)
- sealed bearings (**b**)
- bearings with a two-piece inner ring (**c**).

The standard range is shown in **matrix 1** on **page 441**.

This bearing range covers sizes from 10 to 110 mm bore diameter. For information about other double row angular contact ball bearings, please refer to the "SKF Interactive Engineering Catalogue" online at www.skf.com.

Bearings in the 52 A and 53 A series

Basic design bearings in the 32 A and 33 A series shown in the product table as well as the corresponding sealed bearings to 2Z and 2RS1 design are identical to the corresponding bearings in the 52 and 53 series for the North American market. They have the same performance characteristics and dimensional features (except for the width of size 5200). However, the sealed bearings are filled with a different grease. Bearings in the 52 and 53 series use a mineral oil based high-temperature grease with polyurea thickener. The operating temperature range of this grease is -30 to $+140$ °C. The base oil viscosity is $115 \text{ mm}^2/\text{s}$ at 40 °C and $12 \text{ mm}^2/\text{s}$ at 100 °C.

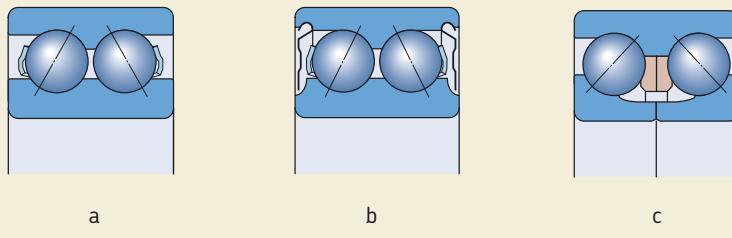

Fig. 1

Fig. 2

Basic design bearings

SKF double row angular contact ball bearings in the 32 A and 33 A series have optimized internal geometry and do not have filling slots. The advantages are

- universal applicability
- high radial and axial load carrying capacity in both directions
- quiet operation.

The bearings have a 30° contact angle and the ball sets are in a back-to-back arrangement.

Standard design bearings that are also available with seals or shields may, for manufacturing reasons, have seal recesses on inner and outer rings (→ fig. 2).

Sealed bearings

The most common basic design bearings can also be supplied with shields or seals (→ matrix 1 on page 441). Bearings in the 32 A and 33 A series are filled with a high-quality NLGI class 3 grease with a lithium thickener and are marked with the designation suffix MT33. This grease has good corrosion inhibiting properties and has a temperature range of -30 to +120 °C. The base oil viscosity is 98 mm²/s at 40 °C and 9,4 mm²/s at 100 °C. Regarding the grease fill of bearings in the 52 A and 53 A series please refer to page 434.

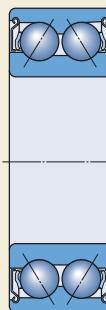

Sealed bearings are lubricated for life and are maintenance-free. They should therefore not be washed or heated above 80 °C before mounting.

Bearings with shields

Bearings with shields, designation suffix 2Z, are produced in two different designs (→ fig. 3). The sheet steel shields used in smaller bearings form a narrow gap with the land of the inner ring shoulder (a). Larger bearings as well as all SKF Explorer bearings have recesses in the inner ring side faces into which the shields extend (b).

Shielded bearings are primarily intended for applications where the inner ring rotates. If the outer ring rotates there is a risk that grease will be lost from the bearing once it reaches a certain speed.

Fig. 3

a

b

Double row angular contact ball bearings

Bearings with seals

Bearings with seals, designation suffix 2RS1, use a acrylonitrile-butadiene rubber, sheet steel reinforced seal that fits against a recess in the inner ring side face (→ fig. 4). The lip of the seal exerts a light pressure against the inner ring for a positive seal. The periphery of the seal engages in a recess in the outer ring to provide a good sealing. The permissible operating temperature range for these seals is -40 to +100 °C and up to +120 °C for brief periods.

Grease may be lost from sealed bearings at the inner ring under extreme operating conditions, e.g. at high speeds or at high temperatures. For applications where this could be a disadvantage, special design steps should be taken to prevent this. For additional information please contact the SKF application engineering service.

Bearings with a two-piece inner ring

In addition to the basic design bearings, double row angular contact ball bearings are also available with a two-piece inner ring (→ fig. 5). These bearings incorporate a large number of large balls and have a high load carrying capacity, especially in the axial direction.

Bearings in the 33 D series

Bearings in the 33 D series (a) have a 45° contact angle, a special internal clearance and can support heavy axial loads in both directions. The bearings are separable, i.e. the outer ring with ball and cage assemblies can be mounted independently of the inner ring halves.

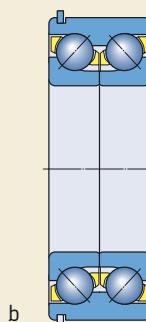

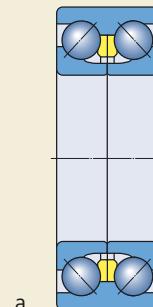

Bearings in the 33 DNRCBM series

Bearings in the 33 DNRCBM series (b) have a 40° contact angle and a snap ring groove with snap ring in the outer ring, enabling simple and space-saving axial location in the housing. They have been designed specifically to operate under the conditions pertaining in centrifugal pumps, but can also be used in other applications. These bearings are non-separable.

Fig. 4

Fig. 5

SKF Explorer class bearings

High performance SKF Explorer angular contact ball bearings are shown with an asterisk in the product tables. SKF Explorer bearings retain the designation of the earlier standard bearings, e.g. 3208 ATN9. However, each bearing and its box are marked with the name "EXPLORER".

Bearing data – general

Dimensions

The boundary dimensions of SKF double row angular contact ball bearings are in accordance with ISO 15:1998, except for the width of bearing 3200 A.

The dimensions of the snap ring grooves and snap rings for bearings in the 33 DNRCBM series are listed in **table 1**. The dimensions of the snap ring grooves and snap rings conform to ISO 464:1995.

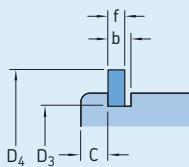

Tolerances

SKF basic design double row angular contact ball bearings are produced to Normal tolerances as standard. SKF Explorer bearings as well as bearings in the 33 DNRCBM series are produced to tolerance class P6 specifications.

The values for tolerances correspond to ISO 492:2002 and can be found in **tables 3** and **4** on **pages 125 and 126**.

Table 1

Dimensions of snap ring grooves and snap rings

Bearing Designation	Dimensions					Snap ring Designation
–	C	b	f	D ₃	D ₄	–
mm						
3308 DNRCBM	3,28	2,7	2,46	86,8	96,5	SP 90

3313 DNRCBM	4,06	3,4	2,82	135,2	149,7	SP 140

Double row angular contact ball bearings

Internal clearance

SKF double row angular contact ball bearings in the 32 A and 33 A series are produced as standard with Normal axial internal clearance. They are also available with the greater C3 clearance (→ **matrix 1** on **page 441**). For bearings with smaller C2 clearance, please check availability before ordering.

Bearings in the 33 D and 33 DNRCBM series are produced exclusively with an axial internal clearance according to the values provided in **table 2**. They are valid for bearings before mounting under zero measuring loads.

Misalignment

Misalignment of the outer ring with respect to the inner ring of double row angular contact ball bearings can only be accommodated by generating forces between the balls and the raceways. Any misalignment will lead to increased noise in operation and reduced bearing service life.

Influence of operating temperature on bearing material

SKF angular contact ball bearings undergo a special heat treatment. When equipped with a steel or brass cage, they can operate at temperatures of up to +150 °C.

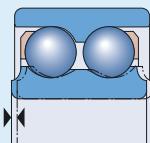

Cages

Depending on the bearing series, size and design, SKF double row angular contact ball bearings are fitted as standard with two of each of the following cages (→ **fig. 6**)

- an injection moulded snap-type cage of glass fibre reinforced polyamide 6,6, ball centred, designation suffix TN9 (**a**)
- a pressed snap-type steel cage, ball centred, no designation suffix or suffix J1 (**b**)
- a pressed steel crown cage, ball centred, no designation suffix (**c**)
- a pronged machined brass cage, outer ring centred, designation suffix MA (**d**)

Table 2

100	110	4	30	22	53	42	73	65	96	-	-

- a machined window-type brass cage, ball centred, designation suffix M (**e**).

Several bearings are available as standard with a choice of cage design so that bearings with a cage appropriate to the operating conditions can be chosen (→ **matrix 1 on page 441**).

Note

Bearings with polyamide 6,6 cages can be operated at temperatures up to +120 °C. The lubricants generally used for rolling bearings do not have a detrimental effect on cage properties, with the exception of a few synthetic oils and greases with a synthetic oil base, and lubricants containing a high proportion of EP additives when used at high temperatures.

For detailed information about the temperature resistance and the applicability of cages, please refer to the section "Cage materials", starting on **page 140**.

Minimum load

In order to provide satisfactory operation, double row angular contact ball bearings, like all ball and roller bearings, must always be subjected to a given minimum load, particularly if they are to operate at high speeds or are subjected to high accelerations or rapid changes in the direction of load. Under such conditions, the inertia forces of the balls and cages, and the friction in the lubricant, can have a detrimental influence on the rolling conditions in the bearing arrangement

and may cause damaging sliding movements to occur between the balls and raceways.

The requisite minimum radial load to be applied to double row angular contact ball bearings can be estimated using

$$F_{rm} = k_r \left(\frac{v n}{1000} \right)^{2/3} \left(\frac{d_m}{100} \right)^2$$

where

F_{rm} = minimum radial load, kN

k_r = minimum radial load factor

0,06 for bearings in the 32 A series

0,07 for bearings in the 33 A series

0,095 for bearings in the 33 D and
33 DNR series

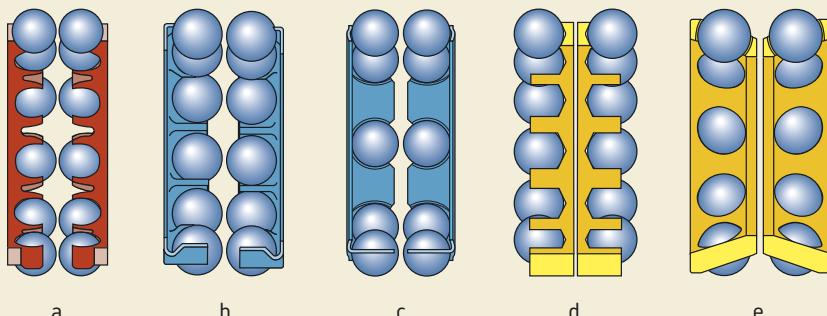

v = oil viscosity at operating temperature,
mm²/s

n = rotational speed, r/min

d_m = bearing mean diameter
= 0,5 (d + D), mm

When starting up at low temperatures or when the lubricant is highly viscous, even greater minimum loads may be required. The weight of the components supported by the bearing, together with external forces, generally exceed the requisite minimum load. If this is not the case, the double row angular contact ball bearing must be subjected to an additional radial load.

Fig. 6

Double row angular contact ball bearings

Equivalent dynamic bearing load

$$P = F_r + Y_1 F_a \quad \text{when } F_a/F_r \leq e$$

$$P = X F_r + Y_2 F_a \quad \text{when } F_a/F_r > e$$

The values for the factors e , X , Y_1 and Y_2 depend on the bearing contact angle and are listed in **table 3**.

Equivalent static bearing load

$$P_0 = F_r + Y_0 F_a$$

The value for the factor Y_0 depends on the bearing contact angle and is provided in **table 3**.

Supplementary designations

The designation suffixes used to identify certain features of SKF double row angular contact ball bearings are explained in the following.

A	No filling slots
CB	Controlled axial internal clearance
C2	Axial internal clearance smaller than Normal
C3	Axial internal clearance greater than Normal
D	Two-piece inner ring
J1	Pressed snap-type steel cage, ball centred
M	Machined window-type brass cage, ball centred
MA	Pronged machined brass cage, outer ring centred
MT33	Grease with lithium thickener of consistency 3 to the NLGI Scale for a temperature range -30 to +120 °C (normal fill grade)
N	Snap ring groove in the outer ring
NR	Snap ring groove in the outer ring, with snap ring
P5	Dimensional and running accuracy to ISO tolerance class 5
P6	Dimensional and running accuracy to ISO tolerance class 6
P62	P6 + C2
P63	P6 + C3
2RS1	Sheet steel reinforced contact seal of acrylonitrile-butadiene rubber (NBR) on both sides of the bearing
TN9	Injection moulded snap-type cage of glass fibre reinforced polyamide 6,6, ball centred
W64	Solid Oil filling
2Z	Shield of pressed sheet steel on both sides of the bearing

Designs

Four-point contact ball bearings are radial single row angular contact ball bearings with raceways that are designed to support axial loads acting in both directions. Radial loads can be supported up to a certain fraction of the axial load. These bearings take up considerably less axial space than double row bearings.

The standard range of SKF four-point contact ball bearings comprises bearings in the QJ 2 and QJ 3 series (→ fig. 1). They are available as

- basic design bearings or
- bearings with locating slots.

In addition, SKF four-point contact ball bearings are available in other dimension series, designs, and sizes. For information on these bearings, consult the "SKF Interactive Engineering Catalogue" online at www.skf.com.

Basic design bearings

Four-point contact ball bearings shown in this catalogue have a 35° contact angle and are designed to accommodate predominantly axial loads. The inner ring is split. This enables a large number of balls to be incorporated in the bearing thus giving the bearing high load carrying capacity. The bearings are separable, i.e. the outer ring with ball and cage assembly can be mounted separately from the two inner ring halves.

Both inner ring halves of SKF Explorer four-point contact ball bearings have a recessed shoulder. This improves the oil flow when the bearing is used together with an SKF cylindrical roller bearing (→ fig. 2). In addition, these recesses can be used to facilitate dismantling.

Bearings with locating slots

In many applications a radial bearing is used in combination with a four-point contact ball bearing which acts as a pure thrust bearing and is mounted with radial clearance in the housing (→ fig. 2). To restrain the outer ring from turning in the circumferential direction, bearings with two locating slots (designation suffix N2) in the outer ring positioned at 180° to each other are available (→ fig. 3).

Fig. 1

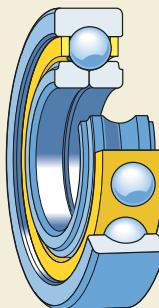

Fig. 2

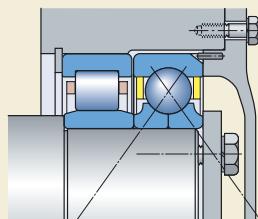

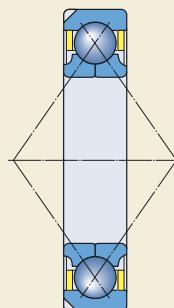

Fig. 3

SKF Explorer class bearings

High performance SKF Explorer four-point contact ball bearings are shown with an asterisk in the product table. SKF Explorer bearings retain the designation of the earlier standard bearings, e.g. QJ 309 N2MA. However, each bearing and its box are marked with the name "EXPLORER".

Bearing data – general

Dimensions

The boundary dimensions of SKF four-point contact ball bearings are in accordance with ISO 15:1998.

Tolerances

SKF four-point contact ball bearings are produced as standard to Normal tolerances. Some sizes are also available with enhanced precision to tolerance class P6 specifications.

SKF Explorer four-point contact ball bearings meet the specifications for P6 running accuracy. The dimensional accuracy complies with Normal tolerances, except that the width tolerance is reduced to 0/-40 µm.

The values for tolerances correspond to ISO 492:2002 and can be found in **tables 3** and **4** on **pages 125 and 126**.

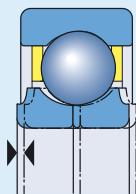

Internal clearance

SKF four-point contact ball bearings are supplied with Normal axial internal clearance as standard, but some sizes are available with greater or smaller clearance, or with reduced clearance limits.

The actual clearance limits are provided in **table 1** and are valid for bearings before mounting under zero measuring load.

180	220	96	176	156	226	206	276	256	326

Misalignment

The ability of four-point contact ball bearings to tolerate misalignment of the inner ring with respect to the outer ring, and consequently the ability to compensate for misalignment in the application or to tolerate shaft deflections is limited. It depends on the internal clearance in operation, bearing size and the magnitude of the forces and moments acting on the bearing. The interrelationship of these factors is complex and no general rules can be provided.

Any misalignment will lead to increased running noise, cage stresses and reduced bearing service life.

Influence of operating temperature on bearing material

SKF four-point contact ball bearings undergo a special heat treatment. When fitted with a brass or PEEK cage, they can operate at temperatures of up to +150 °C.

Cages

SKF four-point contact ball bearings are fitted with one of the following cages

- a machined window-type brass cage, outer ring centred, designation suffix MA (→ fig. 4)
- an injection moulded window-type cage of glass fibre reinforced polyetheretherketone (PEEK) with lubrication grooves in the guiding surfaces, outer ring centred, designation suffix PHAS.

If bearings with a PEEK cage are required, other than listed, please contact the SKF application engineering service.

Minimum load

In order to provide satisfactory operation, four-point contact ball bearings, like all ball and roller bearings, must always be subjected to a given minimum load, particularly if they are to operate at high speeds or are subjected to high accelerations or rapid changes in the direction of load. Under such conditions, inertia forces of the balls and cage, and the friction in the lubricant, can have a detrimental influence on the rolling conditions in the bearing and may cause sliding

damaging movements to occur between the balls and raceways.

The requisite minimum load to be applied to four-point contact ball bearings can be estimated using

$$F_{am} = k_a \frac{C_0}{1\,000} \left(\frac{n d_m}{100\,000} \right)^2$$

where

F_{am} = minimum axial load, kN

k_a = minimum axial load factor

1 for bearings in the QJ 2 series

1,1 for bearings in the QJ 3 series

C_0 = basic static load rating, kN
(→ product table)

n = rotational speed, r/min

d_m = bearing mean diameter
= 0,5 (d + D), mm

When starting up at low temperatures or when the lubricant is highly viscous, even greater minimum loads may be required. The weight of the components supported by the bearing, together with external forces, generally exceeds the requisite minimum load. If this is not the case, the four-point contact ball bearing must be subjected to an additional axial load, for example, by means of springs.

Fig. 4

Equivalent dynamic bearing load

If four-point contact ball bearings are arranged as locating bearings and have to accommodate both radial and axial loads, the equivalent dynamic bearing load is obtained from

$$P = F_r + 0,66 F_a \quad \text{when } F_a/F_r \leq 0,95$$
$$P = 0,6 F_r + 1,07 F_a \quad \text{when } F_a/F_r > 0,95$$

It should be noted that four-point contact ball bearings will only function properly when the ball contacts at only one point on the outer ring raceway and at one point on the inner ring raceway. This is the case if the axial load $F_a \geq 1,27 F_r$.

If the four-point contact ball bearing is arranged with radial freedom in the housing to act as a thrust bearing in combination with a radial bearing (the usual arrangement for these bearings, → **fig. 2 on page 452**), then the equivalent dynamic bearing load becomes

$$P = 1,07 F_a$$

Equivalent static bearing load

$$P_0 = F_r + 0,58 F_a$$

Supplementary designations

The designation suffixes used to identify certain features of SKF four-point contact ball bearings are explained in the following.

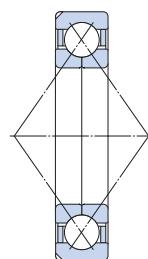

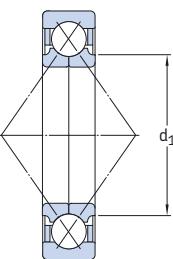

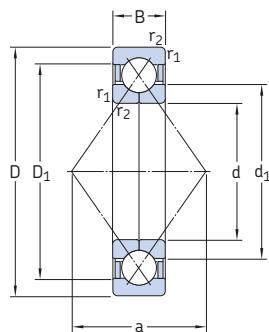

B20	Reduced width tolerance
C2	Axial internal clearance smaller than Normal
C2H	Axial internal clearance in the upper half of the C2 range
C2L	Axial internal clearance in the lower half of the C2 range
C3	Axial internal clearance greater than Normal
C4	Axial internal clearance greater than C3
CNL	Axial internal clearance in the lower half of the Normal range
FA	Machined window-type steel cage, outer ring centred
MA	Machined window-type brass cage, outer ring centred

N2	Two locating slots (notches), 180° apart, in one of the outer ring side faces
PHAS	Injection moulded window-type cage of glass fibre reinforced polyetheretherketone (PEEK), with lubrication grooves in the guiding surfaces, outer ring centred
P6	Dimensional and running accuracy to ISO tolerance class 6
P63	P6 + C3
P64	P6 + C4
S1	Bearing rings dimensionally stabilized for use at operating temperatures up to +200 °C
344524	C2H + CNL

Design of bearing arrangements

The outer ring of bearings, which are arranged as thrust bearings with radial clearance in the housing, should not be clamped (→ **fig. 2, page 452**). Otherwise the outer ring cannot compensate for thermal movements, which will cause additional force in the bearing. If clamping the outer ring cannot be avoided, the outer ring must be at least carefully centred during mounting.

Designs

SKF double row cam rollers (→ fig. 1) have been developed from double row angular contact ball bearings and have a 25° contact angle. They are ready-to-mount pre-greased units and are used for all types of cam drives, conveyor systems etc. They are fitted with pressed steel shields which form a long sealing gap with the inner ring shoulder to keep the lubricant in and contamination out.

Double row SKF cam rollers are available in two designs

- with a crowned runner surface, series 3058(00) C-2Z
- with a cylindrical (flat) runner surface, series 3057(00) C-2Z.

Cam rollers with crowned runner surfaces should be used where there is angular misalignment with respect to the track and where edge stresses need to be minimized. In addition to the double row cam rollers, the SKF standard range of track runner bearings contains other cam rollers, support rollers, and cam followers. These are, for example

- single row cam rollers, series 3612(00) R (→ page 399)
- support rollers based on needle roller or cylindrical roller bearings
- cam followers based on needle roller or cylindrical roller bearings.

For additional information on support rollers and cam followers, consult the catalogue “Needle roller bearings” or the “SKF Interactive Engineering Catalogue” online at www.skf.com.

Cam roller data – general

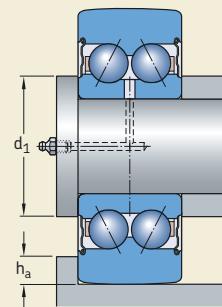

Dimensions

Except for the outside diameter, boundary dimensions of SKF double row cam rollers are in accordance with ISO 15:1998 for bearings in the 32 dimension series.

Fig. 1

Fig. 2

Tolerances

SKF double row cam rollers are produced to Normal tolerances as standard, except for the tolerance of the diameter of the crowned runner surface, which is twice the Normal tolerance.

The values for tolerances correspond to ISO 492:2002 and can be found in **table 3** on **page 125**.

Internal clearance

Double row cam rollers are produced with the Normal axial internal clearance of double row angular contact ball bearings (→ **table 2** on **page 438**).

Cages

Double row cam rollers are fitted with two injection moulded snap-type cages of glass fibre reinforced polyamide 6,6, ball centred, no designation suffix. They can operate at temperatures of up to +120 °C.

Load carrying ability

In contrast to normal ball bearings, where the outer ring is supported over its entire outside diameter surface in the bore of a housing, the outer ring of a cam roller has only a small contact area with the surface against which it runs, e.g. a rail or cam. The actual contact area depends on the applied radial load and whether the runner surface is crowned or cylindrical. The deformation of the outer ring caused by this limited contact alters the force distribution in the bearing and thus has an influence on load carrying ability. The basic load ratings provided in the product table take this into account.

The ability to carry dynamic loads depends on the requisite life, but with reference to the deformation and the strength of the outer ring, the value of the maximum dynamic radial load F_r must not be exceeded.

The permissible static load for a cam roller is determined by the smaller of the values of F_{0r} and C_0 . If requirements regarding smooth running are below normal, the static load may exceed C_0 but should never exceed the maximum permissible static radial load F_{0r} .

Axial load carrying capacity

Cam rollers are intended for predominantly radial loads. If an axial load acts on the outer ring, as when the cam roller runs against a guide flange, it will produce a tilting moment and the service life of the cam roller may be reduced as a consequence.

Design of associated components

Pins

With few exceptions, cam rollers operate with outer ring rotation. If easy displacement of the inner ring is required, the pin or shaft should be machined to a g6 tolerance. If, however, a tighter fit is required, then the pin or shaft should be machined to a j6 tolerance.

For cam rollers subjected to heavier axial loads, the inner ring should be supported over its entire side face (→ fig. 2). The diameter of the supporting surface should be the same as the face diameter d_1 of the inner ring.

Guide flanges

For rails or cams with guide flanges (→ fig. 2), the recommended flange height h_a should not exceed

$$h_a = 0,5 (D - D_1)$$

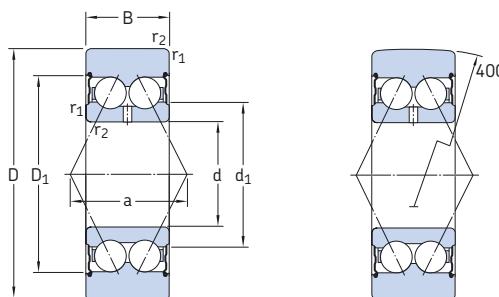

This helps to avoid damage to shields fitted in the outer ring. The values for the outer ring diameters D and D_1 are listed in the product table.

Lubrication

SKF double row cam rollers are filled with a grease with lithium thickener of consistency 3 to the NLGI Scale. This grease has good rust inhibiting properties and has a temperature range of -30 to +120 °C. The base oil viscosity is 98 mm²/s at 40 °C and 9,4 mm²/s at 100 °C.

Under normal operating conditions, these cam rollers are maintenance-free. However, if they are subjected to moisture or solid contaminants, or if they run for long periods at temperatures above 70 °C they should be relubricated. The inner ring has a lubrication hole for this purpose. A grease with lithium thickener should be used for relubrication, preferably the SKF LGMT 3 grease. The grease should be applied slowly to avoid damaging the shields.
